

This article explores the classification and applications of solar photovoltaic glass. Photovoltaic glass substrates used in solar cells typically include ultra-thin glass, surface-coated glass, and low-iron (extra-clear) glass.

The classification of photovoltaic glass mainly includes ultra white photovoltaic embossed glass, ultra white processed Float glass, TCO glass and backplane glass. The main characteristics are analyzed as follows: (1) Ultra White Photovoltaic Embossed Glass

The glass used in photovoltaic power generation is not ordinary glass, but TCO conductive glass. HHG is a professional glass manufacturer and glass solution provider include range of tempered glass, laminated glass, textured glass and etched glass.

It is composed of low iron glass,solar cells,film,back glass,and special metal wires. The solar cells are sealed between a low iron glass and a back glass through film,making it the most innovative high-tech glass product for construction. Using low iron glass to cover solar cells can ensure high solar transmittance.

With global attention on environmental protection and energy efficiency steadily rising, the demand for solar photovoltaic glass in both commercial and residential construction sectors has significantly increased. The desire to reduce energy costs and carbon footprint has driven the widespread adoption of solar photovoltaic glass.

At present, the mainstream product in the market is 3.2mm ultra white photovoltaic glass, with solar cell spectral wavelengths ranging from 320 to 1100 nanometers, and solar transmittance reaching up to 91% to 92%. Can be used as a packaging board for crystalline silicon solar modules.
